## Lab: Easy mode

Frank Edwards

4/24/2020

## **GLMs**

## Refresher: lm()

• We can fit a frequentist regression model with a normal likelihood (using OLS) with the lm() function.

#### Refresher: lm()

- We can fit a frequentist regression model with a normal likelihood (using OLS) with the lm() function.
- R formulas take on an outcome ~ predictor1 + predictor2, data structure

```
library(broom)
data(WaffleDivorce)
m0<-lm(Divorce ~ Marriage, data = WaffleDivorce)
tidy(m0)</pre>
```

#### Refresher: transformations and interactions

## 3 South

-6.64

## 4 Marriage:South 0.385

- We can use math functions like log(), exp() and sqrt() on outcomes or predictors
- To use other math, wrap a statement in I()

```
m1<-lm(log(Divorce) ~ sqrt(Marriage) + I(WaffleHouses / Population), data = WaffleDivorce)
tidv(m1)
## # A tibble: 3 x 5
                             estimate std.error statistic

#### The GLM function and model families

- We can estimate generalized linear models using glm()
- The family argument specifies the likelihood: family = "binomial", "gaussian", "Gamma", "poisson" are most common
- · The canonical link function for each family is specified by default

```
admissions <- read_csv("https://stats.idre.ucla.edu/stat/data/binary.csv")
head(admissions)

# Bayesian models with lme4 and glm syntax

## The brms package

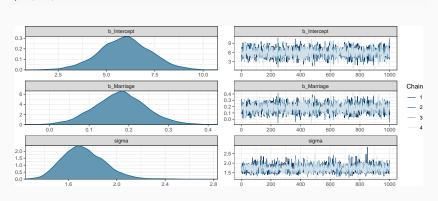

- brms uses the core R and lme4 formula syntax, but uses rstan and HMC to fit models
- · we can specify priors relatively easily
- For a full translation of Statistical Rethinking into brms, see this very detailed guide: https://bookdown.org/ajkurz/ Statistical\_Rethinking\_recoded/

#### Multilevel models

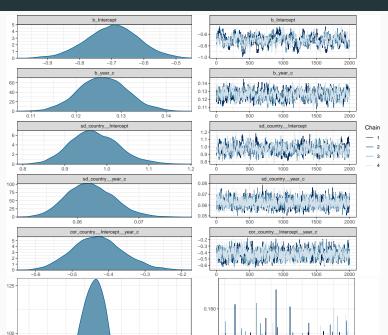

brms is built to accept the syntax of lme4 - like formulas

```
gapminder<-gapminder %>%
  mutate(L c = scale(lifeExp),
         year c = ((year - min(year))/5))
brm7<-brm(L c ~ year c + (year c country),</pre>
         data = gapminder, family = gaussian,
         prior = c(prior(normal(0, 5), class = Intercept),
                   prior(exponential(1), class = sigma),
                   prior(normal(0,2), class = b),
                   prior(lkj(2), class = cor)),
         iter = 4000. cores = 4)
```

#### summary(brm7)
